PREFACE

In recent years there has been significantly increasing interest by minorities and women in careers in the health fields. Broad social changes and the enactment of civil rights legislation prohibiting discrimination on the basis of race and sex have played a large role in this increasing interest, but a major part of the upward surge of minorities and women into the health fields is due to financial and other incentives provided by the Federal government.

Beginning with the passage of the Health Professions Educational Assistance Act (HPEA) PL 88-129, in 1963, Federal legislation has encouraged and provided financial support for a variety of programs aimed at bringing more minorities and women into the health fields. Many of these programs, as well as some new ones, are now incorporated into the Health Professions Educational Assistance Act of 1976 (PL 94-484), with most of them administered by the Bureau of Health Manpower (BHM), a component of the Health Resources Administration (HRA), Public Health Service, Department of Health, Education, and Welfare.

The Bureau of Health Manpower's major goal is to provide an adequate supply, mixture, and distribution of workers to meet the Nation's health manpower needs. Keeping abreast of the changes in the participation of minorities and women in the health care fields is a major aspect of this task of assuring an adequate supply of health manpower, and in 1974 BHM issued a report, DHEW Publication No. (HRA) 75-22, entitled *Minorities and Women*

in the Health Fields. That report presented a collection of statistical tables containing much of the available data on the representation of minorities and women in the health professions and in training programs for the health fields. The report proved useful to many persons and organizations, and was updated and expanded in 1975 as DHEW Publication No. (HRA) 76-22, also entitled *Minorities and Women in the Health Fields*. The present report updates and further expands the data presented in those two earlier reports.

The present report presents a more comprehensive look at the current and potential supply of minorities and women in the health fields. It is hoped that the report can be used as a planning tool for the assessment of the progress being made toward a more equitable race/ethnic and sex distribution in the health fields, and can assist in arriving at a better understanding of the composition of the Nation's health manpower supply.

This report was prepared by Wilbertine P. Philpot of the Bureau of Health Manpower's Division of Manpower Analysis, Medicine, VOPP, and Allied Health Section, Stuart Bernstein, Acting Chief. Selma L. Warsaw and Brenda Parker among others provided secretarial services; and Grace T. Chalmers edited the statistical tables in the report.

HOWARD V. STAMBLER,
Director
Division of Manpower Analysis

INTRODUCTION

This report presents selected information on minorities and women in the health professions and in health professions schools. It is divided into two parts. The first part presents a series of tables containing the most current data available on the number of minority students enrolled in health professions schools and on the numbers of minority persons working in health occupations. The second part of the report contains essentially the same information, cross classified by sex.

The data presented in this report are more extensive than those presented in either of the two earlier reports published by the Bureau of Health Manpower (BHM). However, data on males and females are more generally available than are data on minorities, consequently, substantially more data by sex are presented in this report.

The reader should keep in mind that many of the tables in the report contain data which are not entirely compatible with those in other tables. The racial/ethnic categories, in particular, may differ among health occupations, largely because of the different organizations collecting the data. For example, the BHM Student Loan and Scholarship Annual Operating Report, which is the source for some of the racial/ethnic student data, includes foreign students in each racial/ethnic category, while most other sources exclude foreign students from these counts. Similarly, some tables, e.g. those of the Bureau of the Census, do not classify persons of Spanish language as minorities, whereas others include such persons. Where appropriate, footnotes on the tables provide clarification of the coverage of the data.

It is hoped that future reports in this series will provide more comparable data. In 1975, the Office of Management and Budget issued a standard minimum list of categories and definitions of racial/ethnic designations to be used by Federal agencies in the collection of data. The five mutually exclusive categories are: American Indian or Alaskan Native, Asian or Pacific Islander, Black (not of Hispanic Origin), Hispanic, White (not of Hispanic Origin). These categories are increasingly being used in the collection of data by the Federal government and are also being followed by non-Federal data collectors. The racial/ethnic designations used in this report, however, are generally the designations used in the source from which the data were obtained. Since much of the data are from non-Federal sources and from Federal data collection efforts which preceded the establishment of the standard racial/ethnic categories, the minority group designations used in the tables are not always strictly comparable.

The reader should also bear in mind the variability and inconsistencies in the sample size of the various universes from which much of the decennial Census occupational data are drawn. Census occupational data are classified according to self-reporting by individuals or by some member of their families, with all the attendant errors, and the data are generally based on a 20 percent sample, so that the sampling errors may be substantial. As a result, Census data tend to differ in many ways from those collected in other ways by other groups. Nevertheless, when viewed along with the other data included, this Census information can be of substantial help in evaluating the composition of the health manpower workforce.

SUMMARY

In the mid-1970's, minorities were an estimated 12.9 percent of the total U.S. population and a little less than 10 percent of the employed civilian labor force. During the decade of the 1960's and early 1970's, a great degree of occupational upgrading occurred among minorities, and there were major increases in minority participation in the health fields. However, minority employees still lag behind other employees in the proportion of workers holding high-paying, high-status jobs. Minorities continue to be overrepresented in lower paying, less skilled jobs, and underrepresented in most white collar occupations. In the health fields, minority workers were only 7 percent of all medical and other professional health workers, but were 22 percent of nonprofessional health service workers.

Over the past decade, the proportion of minority students in institutions of higher education has been increasing steadily, resulting in a larger pool from which potential professional health workers can be drawn. Although the number and the proportion of minority students in all areas of health professions education and training has shown steady growth since the late 1960's, there has been wide variation among individual fields. In the 1976-77 school year, the proportion of minority students ranged from 11.0 percent in medicine and 10.1 percent in dentistry, to 4.2 percent in osteopathic medicine. Blacks are the largest minority group in each health profession, except for op-

tometry, where Orientals comprise the largest minority group.

For women, the increases in their participation in the health professions have been even more striking than for minorities. For example, in the 1970-71 academic year, less than 4,000 women were enrolled in U.S. medical schools, and there were only 827 women graduates. By the 1976-77 school year, the proportion of women in U.S. medical schools had more than tripled, and there were more than 2,600 women graduates. Similarly, the proportion of women in the first-year class of veterinary medical schools has increased substantially. In the 1968-69 school year, less than one-tenth of all first-year students were female; by the 1976-77 school year, nearly one-third of all first-year veterinary students were women.

Women have earned an increasing proportion of degrees at all degree levels during the 1970's. Among the major health professions, the proportionate increases have been even greater than in most other professions. In 1960, women earned only 0.8 percent of all first professional degrees awarded in dentistry, 1.2 percent of those awarded in optometry, and 2.2 percent of all degrees awarded in veterinary medicine. By 1976, these percentages had risen to 4.5 for dentistry, and to 17 and 18 percent, respectively, for optometry and veterinary medicine. As a result of these increases, the coming years should see a significant rise in the number of women and minorities in the health fields.

Minorities & Women in the Health Fields

Part I Racial-Ethnic Tables

In 1976, persons of black and other races comprised over 13 percent of the total resident population in the United States. The vast majority of this group were black Americans.

Table 1

1976	100.0	13.2	6.3	6.9	11.5	5.5	6.0

¹ The term "Black and other races" describes persons of all races other than white. Statistics for this group usually reflect the condition of the black population, since about 90 percent of the population of black and other races is black.

In 1974, minorities were 7 percent of all employed professional health workers, and 22 percent of all employed unskilled health service workers.

Source: The Social and Economic Status of the Black Population in the United States, 1974, U.S. Bureau of the Census, Current Population Reports, Special Studies, Series P-23, No. 54. Washington, D.C.

The proportion of minorities enrolled as undergraduate students in institutions of higher education increased from 9.5 percent in 1968–69 to 13.5 percent in 1974–75. Black students were by far the largest minority group in each academic year.

Table 3

¹ Includes full-time undergraduate students in institutions in the 48 coterminous States and the District of Columbia which received or expect to receive Federal financial assistance. Full time is defined as taking credits equal to at least 75 percent of a normal load. This report is based on responding institutions and covers about 91 percent of all full-time students in institutions of higher education in 1972–73.

² The minority categories exclude foreign students.

³ Includes all foreign students and U.S. minority students in other than the specified categories.

Source: U.S. Department of Health, Education, and Welfare; Office for Civil Rights. Racial and Ethnic Enrollment Data From Institutions of Higher Education, Fall 1974. In press. Also prior editions.

Note: Percents may not add to totals and subtotals due to independent rounding.

Among the health professions, medicine has the highest proportion of minority students, 11.0 percent, followed by dentistry, with 10.1 percent, and pharmacy with 8.9 percent. Nursing reported 13.6 percent minority enrollment.

Source: Medical Education in the United States, The Journal of the American Medical Association; Vol. 238, No. 26, December 1977.

In 1976-77, members of racial minority groups were approximately 11 percent of the total student population in U.S. medical schools, up from just under 4 percent in 1968-69. Black students were the largest minority group, but the number of American Indian and Mainland Puerto Rican students has increased significantly, from 9 and 3 in 1968-69 to 186 and 232, respectively, in 1976-77. However, in recent years the proportion of minority students in all groups, especially blacks, appears to be stabilizing.

Medical schools in California and New York enrolled the largest numbers of minority students, 515 and 433, respectively. Howard and Meharry Universities, the two predominately black medical schools, enrolled one-fifth all black students.

The number of black physicians serving in approved AMA internship and residency programs continues to increase. As of September 1974, 421 black physicians were serving in an internship program, 87 more than were serving one year earlier. The 1,113 black physicians in residency programs represent 81 more than were reported in 1973-74.

Twelve percent of salaried medical school faculty in 1975 were members of racial/ethnic minority groups. This proportion was higher for faculty with M.D. degrees than for faculty with other degrees. Among minority faculty, Chinese/Japanese were the second largest group while other Asians constituted the largest group.

Note: Percents may not add to totals and subtotals due to independent rounding.

In 1970, Black physicians were only 2 percent of all active physicians (M.D. and D.O.) in the United States. The largest number was in New York where they constituted 3 percent of the active physicians.

There were almost 10,300 active physicians (3.7 percent) of Spanish language in 1970. The greatest number, 1,743 was in California; the next larger numbers (about 1,300 each) were in Florida and Texas.

¹ First year of operation.

Source: 1976-77 Annual Operating Reports submitted to the Bureau of Health Manpower by health professions schools.

There has been only a modest increase in the proportion of first-year minority dental students since the 1971-72 school year. The proportion of black first-year dental students has remained essentially the same throughout the six academic years; however, there was a slight decline in the number and proportion of black first-year students in the 1976-77 school year.

More than one-fourth of all minority dental students were enrolled in schools in California, almost one-half of these students were Orientals, and one-fourth were Mexican American. Slightly more than two-fifths of all black dental students were enrolled in the two predominately black dental schools, Meharry Medical College and Howard University.

In the 1976-77 school year, 6.7 percent of all dental school faculty were members of racial/ethnic minority groups. Females represented 8.2 percent of the total dental school faculty. Of these 938 women faculty members, only 10.8 percent were women from minority groups.

There were 2,098 active black dentists in the United States in 1970 or 2.3 percent of the total active supply. New York, with 270 had the largest number, and seven other States and the District of Columbia each had more than 100.

Persons of Spanish language accounted for 1.3 percent of active dentists in 1970, with the largest number in California (440). Florida and Texas also had more than 100 dentists each of Spanish language.

The number and the proportion of minority applicants to schools of optometry increased between 1973-74 and 1974-75. Orientals were the largest minority group and Black Americans were the next largest group in both years.

1975-76 and 1976-77 data were provided by the Association of Schools and Colleges of Optometry from the Annual Survey of Optometric Educational Institutions.

Note: Percents may not add to totals and subtotals due to rounding.

Of 298 minority students in schools of optometry in the United States in the Fall of 1976, more than one-half were Asian Americans, and over one-fourth were black Americans. Three-fifths of the Asian Americans were in two schools located in California.

According to a 1973 Survey, there were 480 minority optometrists, representing 2.5 percent of all active optometrists in the United States. More than three-fifths of the minority optometrists were of Asian descent, and about one-fifth were black. Two of every five minorities were located in California, the majority of these optometrists were Asian.

Source: 1973 survey of licensed optometrists conducted by the International Association of Boards of Examiners in Optometry for the Bureau of Health Manpower.

In 1976-77, minority students represented 8.9 percent of the total enrollment in the final three professional years of pharmacy education. Although there was a slight decrease in total enrollment of all students over 1975-76, the number of minorities enrolled remained relatively constant. Among minority groups, black Americans showed the greatest gain, 938 students in 1976-77, an increase of 279 students since 1972-73.

¹ Excludes students at the University of Puerto Rico for all years because these students are mainly residents of Puerto Rico.

² The White American category includes all foreign students for each year except 1971-72 (see footnote 3). The numbers of foreign students included are 463 for 1972-73; 788 for 1973-74; 1,062 for 1974-75; 1,006 for 1975-76; and 824 for 1976-77.

³ Includes mainly Asian American and foreign students.

⁴ Less than 0.05 percent.

Source: Enrollment Report on Professional Degree Programs in Pharmacy, Fall 1976. John F. Schlegel, American Association of Colleges of Pharmacy, Bethesda, Maryland.

In 1976-77, more than one-fifth of the 2,089 minority pharmacy students were enrolled in schools in California. Of these 460 students, more than three-fourths were Asian Americans. The four predominantly black pharmacy colleges, Howard, Florida A&M, Texas Southern, and Xavier, enrolled slightly more than one-half of all black American pharmacy students. The pharmacy school at the University of Oklahoma had the largest number of American Indians, with 10 students.

¹ Total enrollment excludes students at the University of Puerto Rico whose students are mainly residents of Puerto Rico.

² Includes foreign students.

³ Arkansas offers an accelerated program; the two years reported are equivalent to three academic (nine month) years.

⁴ Pacific and Howard offer accelerated programs; the three years reported are equivalent to four academic (nine month) years.

⁵ These schools reported foreign students only.

⁶ Nebraska is terminating the B.S. Pharmacy program, and now accepts students for the Pharm. D. program only.

Source: Enrollment Report on Professional Degree Programs in Pharmacy, Fall 1976. American Association of Colleges of Pharmacy, Bethesda, Maryland.

According to a 1973-74 survey of pharmacists, 4,870, or 4 percent, of all active pharmacists in the United States were members of minority groups. One-half of the minority pharmacists were of Asian descent, and more than two-fifths (42 percent) were black. Over one-third (34.3 percent) of all active pharmacists in the District of Columbia were minorities, nearly nine of every ten were black. Of the minority pharmacists, 37.3 percent were located in California, and more than four-fifths of them were of Asian descent.

The number and the proportion of first-year minority students in podiatric medical schools have more than doubled since 1971-72. Black Americans comprise the largest group, with 25 students, followed by the American Oriental group, with 10 students.

Journal of Podiatric Medical Education, American Association of Colleges of Podiatric Medicine, Volume 8, No. 1, Spring 1977.

The number and the proportion of minority students enrolled in podiatric medical schools have increased significantly since 1971-72. In that year only 40 minority students were enrolled in the five schools, representing only 3.2 percent of the total enrollment. The 1976-77 class showed an enrollment of 135 minority students, increasing the proportion to over 6.0 percent of the total enrollment.

More than one-third of the 125 minority students in podiatric medical colleges were enrolled in the one California school. More than one-half of these 43 students were Oriental. Each of the podiatry schools located in Illinois, New York, and Ohio enrolled about one-fifth of the minority students.

Between the academic years 1971-72 and 1973-74, there was a 32.0 percent increase in the number of minority students enrolled in schools of veterinary medicine. The overwhelming majority of these students in each year were black Americans. However, the number of Oriental and American Indian students doubled over the three year period.

In 1970, only about 1 percent of the employed veterinarians in the United States were black. Of the States, 27 had no veterinarians of black ancestry. The same proportion of veterinarians were persons of Spanish language. Veterinarians of Spanish ancestry were also located in a relatively few States—35 States and the District of Columbia had no veterinarians of Spanish language.

According to a 1974-75 survey of nursing schools, there were 8,159 black students enrolled in 744 of the 1,181 programs which responded to the racial/ethnic question in the survey. There were 2,080 students of Spanish background in 389 nursing programs and 1,083 American Indian and/or Orientals in 346 programs. Of 231 programs, 16.4 percent did not respond to the question as to the number of minorities enrolled.

Approximately 74 percent of the 1,181 nursing programs responding to the racial/ethnic question in the 1974-75 nursing survey reported having at least one black student enrolled, and blacks constituted 8.3 percent of the total enrollment in these programs. Forty-two percent of the responding programs had at least one student of Spanish origin, and these students were 3.5 percent of the total enrollment of the responding schools. There was at least one American Indian and/or Oriental student enrolled in 41 percent of the responding programs, constituting 1.8 percent of the total enrollment in these programs.

Of 1,181 nursing programs, 614, or 52 percent, reported having at least one black among its graduates in 1974-75. The total number of blacks graduating from these programs totalled 3,527, representing 9.2 percent of all graduates in the responding schools. Only 24 percent of these schools had graduates of Spanish background, and 20 percent had either American Indian and/or Oriental graduates. The proportion of Spanish and American Indian and/or Oriental graduates was 5.5 percent, and 3.3 percent, respectively.

Source: Collegiate Programs in Allied Health Occupations 1975-1976, Report 1: Volume 1, National Overview. Prepared by: Philip W. Anderson, Pamela J. Griffith, Lindy Lain, and Richard S. Nunn by American Society of Allied Health Professions, Washington, D. C., July 1978.

Of over 71,000 students in health occupations training programs administered by hospitals in 1973-74, 6,526 (9.2 percent) were members of racial/ethnic minorities. The largest minority group was that of blacks. The highest proportion of minority students were in programs training dietary aides, 63.3 percent.

² Includes both full- and part-time students; total also includes occupations with less than 100 students, not shown separately.

Source: Unpublished data from 1973 survey of hospital-administered programs made by the American Hospital Association for the Bureau of Health Manpower.

Note: The data in this table are based on programs which reported racial/ethnic category of students and may differ from those in Table 91 which relate to all programs in the survey.

The 220 minority students in the first year of dental hygiene programs in 1976-77 represent a 0.6 percent decrease over the 1975-76 figure of 238 first-year students. The largest decrease was among black students, followed by Mexican Americans and Orientals.

The proportion of minorities in the first year of dental laboratory technology training has decreased from 23 percent in 1972-73 to 17 percent in 1976-77. The most significant decreases have occurred among first year black and Puerto Rican students. Enrollment of American Indians shows a proportionate increase, although their representation is still relatively small.

The total enrollment of minority students in dental laboratory technology programs has remained relatively constant for the past several years, except for the 1975-76 school year, when there was a slight decrease.

Source: The Profile of Medical Practice, 1972 edition. Chicago, American Medical Association, 1972.

Medical Education in the United States 1976-77. *Journal of the American Medical Association*, December 26, 1977.

The number of male applicants to medical schools was 242 percent higher in 1976-77 than in 1929-30, while the increase in female applicants in the same period was over 2,000 percent. Because the number of first-year places has not increased as rapidly as the number of applicants, the percent of applicants accepted has decreased in the same period for both males and females. In recent years, slightly higher proportions of female than of male applicants have been accepted.

Table 53

Applicants and acceptances to schools of medicine in the United States by sex: Selected academic years 1929-30 through 1976-77

The proportion of women among total enrollments in medical schools varied from 12.8 percent for Creighton University to 62.3 percent for the formerly all women's school, Medical College of Pennsylvania. Although Creighton had the lowest percentage of women among total enrollments, women comprised nearly one-fifth of the school's first-year class.

The number and the proportion of female graduates of medical schools have increased steadily through the years. In 1972-73, the proportion of female graduates was 8.9 percent, by 1976-77, the proportion had grown to nearly 20 percent. The proportion of male graduates decreased during this period, from 91.1 percent in 1972-73 to 80.8 percent in 1976-77.

Fifteen percent of salaried medical school faculty in 1975 were female. This proportion varied from 10 percent of the faculty with M.D. degrees to 55 percent for faculty with degrees other than M.D. or Ph.D.

Table 59

Salaried faculty in schools of medicine in the United States, by type of degree and sex: 1975

Type of degree	Both sexes	Male	Female	Percent female
Total	40,578	34,459	6,119	15.1
M.D.	26,546	23,923	2,623	9.9
Ph.D.	10,595	8,994	1,601	15.1
Other degrees	3,437	1,542	1,895	55.1

Source: U.S. Department of Health, Education, and Welfare; Public Health Service; Health Resources Administration; Bureau of Health Manpower. Participation of Women and Minorities on U.S. Medical School Faculties. DHEW Publication No. (HRA) 76-91. March 1976.

Nearly 90 percent of the active women physicians were in patient care in 1976, while less than 3.0 percent were engaged in medical teaching, and slightly less than 4.0 percent were in administration. The remainder, about 4.0 percent, were employed in research or some other activity. Of the women physicians in patient care, about one-eighth were general practitioners, most were in one of the medical specialties.

Excludes 5,078 women physicians who are not classified by AMA, 3,535 inactive, and 1,182 whose address was unknown.

Source: Physician Distribution and Medical Licensure in the United States, 1976. Center for Health Services Research and Development. American Medical Association, Chicago, 1978.

The majority of all active physicians are classified in "patient care." However, about one-third of all women physicians are on the staff of hospitals, compared to only one-fourth of all physicians. Relatively fewer women are in office-based practice.

Note: Percents may not add to totals and subtotals due to independent rounding.

The proportion of women physicians in most medical specialties has remained relatively constant since 1963. The greatest increases have occurred in internal medicine, pediatrics, general surgery, pathology, and radiology.

Physician Distribution and Medical Licensure in the U.S., 1976. Center for Health Services Research and Development, American Medical Association, Chicago.

Note: Percents may not add to totals and subtotals due to rounding.

Women physicians represent 7.4 percent of all active federal physicians. The Veterans Administration employs more physicians, women as well as men, than any other single branch of service. The majority of these, regardless of branch of service, are in "patient care." Overall, the proportion of Federal women physicians in all major medical activities suggests the same general pattern as that for all Federal physicians.

Approximately 8 percent of all active women physicians are in the Federal service. The majority, nearly 6 of every 10, are employed by the Veterans Administration. Comparing tables 63, and 64 reveals that the distribution of total Federal women physicians according to medical specialty closely parallels that of all Federal physicians. However, there are differences among the various services.

Table 64

Source: Physician Distribution and Medical Licensure in the U.S., 1976. Center for Health Services Research and Development, American Medical Association, Chicago.

The proportion of active non-Federal women physicians located in the regions varied from 11.5 percent in the Middle Atlantic to 5.2 percent in the East South Central. More than 10 percent of the physicians in 8 States were women, including the District of Columbia, which had 15 percent. Nearly 23 percent of the physicians in the Pacific Islands, and about 18 percent of those in the Virgin Islands, were women.

Over nine-tenths of all non-Federal women physicians are located in metropolitan areas. About the same proportion of those in "patient care" are located in these areas. The large proportion of the hospital-based women physicians in metropolitan areas reflects the clustering of interns, residents, and staff physicians in the large metropolitan hospitals.

Table 66

Non-Federal women physicians by metropolitan and non-metropolitan areas, and activity, December 31, 1976

Activity	Total (100.0%)	Metropolitan areas		Non-metropolitan areas

In 1976, women were over one-fifth of the student enrollment in six dental schools, including the Harvard School of Dental Medicine, which had over 32 percent women enrolled. In 27 dental schools, women were between 10 and 20 percent of the total enrollment; in 26 schools, they were less than 10 percent of the total student population.

In 1976, all 50 States and the District of Columbia had at least one woman dentist. The proportion of women dentists in the States ranged from 0.3 percent in Utah to 6.4 percent in the District of Columbia. Overall, however, women represented only 1.4 percent of the total active civilian dentist workforce.

Table 75

The proportion of first-year students in optometry schools ranged from 7.8 percent for Southern College of Optometry in Tennessee to about 25 percent for Indiana University. The Tennessee school also had the lowest proportion of women (6.5 percent) among total enrollments of any other optometry school, although it had the largest number of students enrolled.

In 1974, about 11 percent of all active pharmacists in the United States were women. The proportion of women pharmacists varied from 13.2 percent in the Pacific Region to 8.6 percent in the Middle Atlantic Region. Among the States, Alaska, Hawaii, and Washington had the highest proportion, about 20 percent each. More than one-half (54.1 percent) of all pharmacists in Puerto Rico were women.

Although women represented only 43 percent of all applicants to schools of public health in 1975-76, they accounted for over one-half of all first-year students. In 1975-76, women were nearly one-half of the total enrollment and nearly one-half of all graduates of schools of public health.

The overwhelming majority of degrees in hospital administration at all levels are awarded to men. The proportion of master's degrees awarded to women increased from 14.6 in 1968-69 to 19.7 in 1974-75. The proportion of bachelor's degrees awarded to women during the same period increased four-fold, from 8 to 32 percent.
